

Admin UI Quickstart — Demand Forecasting SaaS

Version: v1.0.0 | Dev quickstart and seeding guide

Your Logo Here

Quick Steps

- 1) Start dev stack: make up
- 2) Seed dev data: make seed-dev (creates super-admin and sample orgs/users)
- 3) Login via POST /v1/auth/login using seeded super-admin credentials
- 4) Admin UI: <http://localhost:3000/app/admin> (or /app/trust for trust pages)

Troubleshooting Tips

- Tail backend logs: make logs (uses docker compose logs -f backend)
- If seed script fails: check DATABASE_URL inside backend container and psql connectivity
- Common fixes: install bcrypt & psycopg2-binary in backend Python environment
- Verify users: run Sprint-13/verify_seed.sh to list users and orgs
